RESEARCH INTERESTS

My research is centered around developing techniques, tools and environments that help build more reliable and secure software. I am interested in finding solutions that allow programmers to better reason about their code, and that efficiently detect bugs, classify them, and diagnose their root cause. I especially focus on bugs that manifest in production, because they are hard and time consuming. I am also interested in efficient runtime instrumentation, hardware and runtime support for enhancing system security, and program analysis under various memory models.

EDUCATION

Ecole Polytechnique Fédérale de Lausanne (EPFL)

Lausanne, Switzerland

Ph.D. in Computer Science

Sep. 2010–Dec. 2015

Thesis: Techniques for Detection, Root Cause Diagnosis,
and Classification of In-Production Concurrency Bugs

Advisor: Prof. George Candea

Middle East Technical University (METU)

Ankara, Turkey

M.Sc. in Electrical and Electronics Engineering

Sep. 2006–Jun. 2009

Thesis: Variability Modeling in Software Product Lines

Graduated with the top grade

Advisor: Prof. Semih Bilgen

B.Sc. in Electrical and Electronics Engineering

Sep. 2002–Jun. 2006

Project: Embedded Target Estimation, Detection, and Tracking

Graduated with High Honors

Advisor: Prof. Arzu Koc

AWARDS AND HONORS

| | |
|---------------------------------------------------------------------------------------------------|-----------|
| EuroSys Roger Needham Award for Best PhD. Thesis in Computer Systems in Europe | 2016 |
| Intel Corp. Software and Services Group, Grant | 2014–2016 |
| VMware Inc., Doctoral Fellowship | 2014–2015 |
| EPFL, Doctoral Fellowship | 2010–2011 |
| Scientific and Technological Research Council of Turkey, Master Scholarship | 2006–2008 |
| Middle East Technical University, Dean’s High Honor List | 2006 |
| Middle East Technical University, Award for Best Team Performance, Undergraduate Final Project | 2006 |
| Turkish Customs Association, Scholarship | 2002–2006 |

EMPLOYMENT

| | |

Research on software reliability with an emphasis on concurrent software

- I developed **Gist**, the first technique for accurately, efficiently, and automatically diagnosing the root causes of in-production failures, by using a combination of static and dynamic program analysis.
- I developed **RaceMob**, the first automated in-production data race detection technique that can be kept always-on and provides high accuracy, by combining static data race detection with adaptive, crowdsourced dynamic data race detection.
- I developed **Portend**, a high-accuracy technique to classify data races according to their potential consequences under arbitrary memory models, by using symbolic program analysis to explore multiple program paths and schedules to determine the effects of data races.
- I developed **Bias-Free Sampling**, a technique that allows efficient sampling of rarely executed code (where bugs often lurk) without over-sampling frequently executed code, by using a new sampling algorithm and existing hardware support.

Research Intern

Jul. 2015–Sep. 2015

Automated root cause diagnosis of failures and security enhancements using hardware support

- I developed a tool that allows developers to determine which program statements operate on a given data type at runtime using a mix of static program analysis and hardware support. In our experiments, this tool reduces the number of statements to examine during debugging by an order of magnitude. This tool is being extended internally at Intel.
- I began investigating hardware support for enhancing system security, in particular, efficient path profiling for auditing and detecting control flow hijack attacks.

VMware Inc.

Research and Development Intern
Automated debugging and runtime control flow tracking

Palo Alto, CA, USA

Jun. 2014–Sep. 2014

- I implemented a runtime for efficient control flow tracking in software. This work formed the basis of my **Gist** work on root cause diagnosis.
- I designed and implemented an infrastructure to remotely debug and profile VMware VCenter virtual machine management software, while it is running in production. This infrastructure is used by VCenter developers at VMWare.

Microsoft Research

Research Intern
Efficient runtime execution sampling technique and low overhead coverage measurement

Redmond, WA, USA

Jun. 2013–Sep. 2013

- I worked on the design of the **Bias-Free Sampling** framework for efficient runtime sampling. I designed and implemented the bias-free sampling framework for managed code (i.e., C#). This tool is internally used at Microsoft.
- I designed and implemented a fault injection tool to detect resource leakage problems using dynamic binary instrumentation.

Siemens Corporate Technology

Senior Software Engineer
Embedded home and industrial automation software

Istanbul, Turkey

Mar. 2008–May 2010

- I designed and implemented a real-time embedded gateway software between Siemens communication processors and a building automation system using C++ on top of VxWorks.

Aselsan Electronic Industries

Software Engineer
Embedded motor control and functional testing infrastructure

Ankara, Turkey

May 2006–Mar. 2008

- I was responsible for a real-time embedded control software for turret motor control. I also designed and implemented a full-system functional testing software using C++ on top of VxWorks for Power PC architectures.

Student Intern

Jun. 2005–Jul. 2005

Embedded software development

- I developed embedded control software for a night vision camera using C++ and PIC assembly on a PIC microcontroller.

TEACHING ASSISTANTSHIP

- Principles of Computer Systems** (graduate level, EPFL) 2014

- Software Engineering** (3rd year undergraduate level, EPFL) 2011, 2012
- In 2012, I was the head teaching assistant

- Programming II** (1st year undergraduate level, EPFL) 2010

RESEARCH MENTORING

Lisa Zhou (1st year Master's)

Sep. 2015–present

- Lisa and I are working on using hardware support for improving the security of software systems. In that regard, Lisa and Benjamin (see below) are building a framework for reproducing security bugs in large applications (e.g., Chrome).

Benjamin Schubert (3rd year undergraduate)

Feb. 2015–present

- Benjamin and I have been working on a framework that enables reliably reproducing failures in systems software like Apache and MySQL. We used this framework to evaluate my **Gist** work on root cause diagnosis. We are now extending this framework to encompass security vulnerabilities.

Ali Kheradmand (3rd year undergraduate)

Jul. 2013–Sep.2013

- Ali and I worked on the **Lockout** project and developed a technique to systematically perturb program executions (without modifying program semantics) to increase the probability of deadlock manifestation. Ali is currently pursuing his Ph.D. at UIUC.

Radu Coman (Master's thesis)

Jan. 2012–Sep. 2012

- Radu and I surveyed common concurrency bug patterns in open source software. After we identified data races as a common bug pattern among the 100 bugs we looked at in Google Code, we built a static data race detector, which I used in my **RaceMob** project. Radu is currently a senior software engineer at Ixia.
